7 **Abstract**

8 Many herbal extracts have been reported to modify significantly, the transformation of normal
9 cells into neoplastic cells. Garlic and its extracts are known for their hypolipidemic,
10 hypoglycemic, antiplatelet aggregating effect as well as for its anticancer effects. Many of
11 these health beneficial effects of garlic are attributed to its principle organosulfur compound
12 diallyl disulfide(DADS). It was thought that DADS may be involved in anticarcinogenic
13 antitumorigenic effect of garlic, hence the present work was undertaken to assess the
14 protective effects of DADS in ehrlich ascites carcinoma (EAC) cells induced hepatoma in mice.
15 The study has three groupsnormal group (group1), the EAC cells implanted mice (group 2)
16 DADS-treated EAC cells implanted mice (group 3). The results indicate a significant decrease
17 in ascitic fluid volume, ascitic fluid cell count, liver tissue amino acid nitrogen levels, liver
18 tissue glutaminase activity liver tissue lactate levels as well as a increase in life span observed
19 in group 3 mice as compared to group 2 mice, suggesting that DADS gives a significant
20 protection in group3 mice probably by decreasing the anaerobic glucose utilization as well as
21 by interfering with protein deoxy ribonucleotide synthesis.

25 Protective Effects of Diallyl Disulfide Against Experimentally Induced Hepatoma in Mice Divya.D ? ,Vickram ?
26 & Kashinath.R.T ? Abstract -Many herbal extracts have been reported to modify significantly, the transformation
27 of normal cells into neoplastic cells. Garlic and its extracts are known for their hypolipidemic, hypoglycemic,
28 antiplatelet aggregating effect as well as for its anticancer effects. Many of these health beneficial effects of garlic
29 are attributed to its principle organosulfur compound diallyl disulfide(DADS). It was thought that DADS may
30 be involved in anticarcinogenic & antitumorigenic effect of garlic, hence the present work was undertaken to
31 assess the protective effects of DADS in ehrlich ascites carcinoma (EAC) cells induced hepatoma in mice. The
32 study has three groupsnormal group (group1), the EAC cells implanted mice (group 2) & DADS-treated EAC
33 cells implanted mice (group 3). The results indicate a significant decrease in ascitic fluid volume, ascitic fluid
34 cell count, liver tissue amino acid nitrogen levels, liver tissue glutaminase activity & liver tissue lactate levels
35 as well as a increase in life span observed in group 3 mice as compared to group 2 mice, suggesting that DADS
36 gives a significant protection in group3 mice probably by decreasing the anaerobic glucose utilization as well
37 as by interfering with protein & deoxy ribonucleotide synthesis. compounds derived from garlic (1,18). The
38 chemoprotective activity has been attributed to the presence of organosulphur compounds in garlic (6,25,31).
39 The principle organosulphur compound present in garlic is diallyl disulphide [DADS] (3,22). Hence it was thought
40 DADS may be responsible for garlic's cancer protective activity. The present work was undertaken to assess the
41 chemoprotective effects of DADS in Ehrlich ascites cells induced hepatoma in mice.

9 RESULTS

42 **1 II.**

43 **2 Materials and Methods**

44 **3 a) Tumor cell line & their Maintenance :**

45 The inoculum of EAC cells was kindly provided by Amala Cancer Research Institute, Thrissur Kerala (India).
46 EAC cells were thereafter propagated by weekly intraperitoneal injection of freshly drawn ascitic fluid (0.5 ml)
47 from a donor mice bearing ascites tumor of 8-10 days old into healthy swiss albino male mice. Transplantation
48 was carried out using sterile disposable syringes under aseptic conditions b) Chemicals :

49 All the chemicals employed in the present study were of Analar grade (A.R). Diallyl disulphide (DADS) was
50 procured from Sigma-Aldrich chemicals Pvt. Ltd. USA.

51 **4 c) Animals :**

52 In the present study, 18 Swiss male albino mice weighing 25-30g were randomly selected from animal house
53 of Basaveshwara Medical College & Hospital, Chitradurga. The experiments were conducted according to the
54 norms of CPCSEA (Committee for the Purpose of Control and Supervision of Experiments on Animals), New
55 Delhi and Ethical clearance was obtained from IAEC (Institutional Animal Ethical Committee) of Basaveshwara
56 Medical College.

57 **5 d) Experimental design :**

58 The mice were divided into 3 groups (6 animals per group)-normal group (group 1), control group [EAC cells
59 implanted mice] (group 2) and protective group [DADS-treated EAC cells implanted mice] (group 3).

60 **6 i. Normal group**

61 This group consists of 6 swiss albino male mice that received 5.0 ml of normal saline /kg body weight orally by
62 gastric intubation daily for a period of 10 days.

63 **7 Introduction**

64 The transformation of normal cells into neoplastic cells involves at least three distinctive phases, namely-initiation,
65 promotion and progression. Many dietary components have been reported to significantly modify each of these
66 phases (30). Garlic (*Allium sativum*) a common dietary component, is known to modify the cancer process.
67 Epidemiologic and clinical studies have shown that consumption of garlic reduced the risks of cancer incidence
68 (5,17,29). A number of studies have demonstrated the chemoprotective activity of garlic by using different garlic
69 preparations including fresh garlic extract, aged garlic, garlic oil and a couple of organosulfur ii. Control group
70 This group consists of 6 swiss albino male mice with experimentally induced hepatoma. About 3x 10 EAC cells
71 were injected intraperitoneally into healthy mice. These mice also received 5.0 ml of normal saline / kg body
72 weight orally by gastric intubation daily for a period of 10 days. A well grown tumor was observed within 7-10
73 days.

74 iii. Protective group This group consists of 6 swiss albino male mice, received 5.0 ml of warm aqueous solution
75 of DADS (100mg/kg body weight) orally by gastric intubation daily for a period of 4 days. On the 4th day 3x
76 10 EAC cells were injected intraperitoneally. Later 5.0 ml warm aqueous solution of DADS (100 mg)/kg body
77 weight was given orally further for a period of 6 days.

78 The mice of all the three groups were maintained on standard lab feed (Amruth Rat Feed, supplied by Pranav
79 Agro Industries, Pune, India) and tap water adlibitum throughout the study. On the 11th day, body weights of
80 mice of all the groups were noted & abdominal circumferences were recorded. Then the mice were anaesthetized &
81 sacrificed. The ascitic fluid was immediately collected in a clean dry graduated tube by puncturing the abdomen.
82 The fluid volume was noted. The ascitic fluid was assayed for total proteins (11) & total cell count was assessed
83 microscopically using Neubauer chamber. The mice were dissected & livers were procured. Blood stains of
84 liver tissues were removed by smooth blotting & were immediately transferred into a clean pre weighed beaker.
85 The weights of liver of individual groups were noted. Later, the liver tissues were refrigerated at 0-2 C in cold
86 phosphate buffer pH 7.4 till further use. Each individual liver tissue procured was processed to analyze various
87 biochemical parameters as follows: a) To 0. The data entry was carried out using MS Office Exel worksheet and
88 statistically evaluated. The P value was calculated using 'student t' test.

90 **9 Results**

91 The results of the present study are given in IV.

92 10 Discussion

93 The eukaryotic cell cycle normally consists of series of events involving -growth stimulus, replication & division
94 (3,23,24). It is known that many allyl sulphur compounds of herbal origin reduce the growth rate of neoplastic
95 cells in culture as well as *invivo* (26), probably by blocking certain events of cell cycle. The results of the present
96 study with 100 mg DADS/ kg bodyweight given to EAC implanted mice (refer table-1) suggests that at this
97 dosage DADS significantly retards the development of ascites. DADS might have interfered with the cell cycle
98 at G2/M phase as it is known that DADS arrest the cell growth at G2/M phase of cell cycle which means of
99 deoxyribonucleotides. This process requires the participation of nucleotide reductase enzyme, which requires
100 thioiredoxin, a sulphhydryl compound for its activity. A possible sulphhydryl exchange reaction of DADS with
101 thioiredoxin as proposed above may reduce its availability hence decreases the production of deoxy ribonucleotides
102 thus reducing the available DNA levels in cancer cell development which is evident from results depicted in table
103 1.

104 Tumor cells do act as nitrogen trappers (??2) which is a required phenomenon for increased protein synthesis
105 essential for rapid cell proliferation as well as cell multiplication. Liver tissue protein levels in group 2 shows a
106 significant raise ($P<0.001$) as compared to group 1 (refer table 2), indicating a rise in protein synthesis, a normal
107 requirement of increased cell multiplication. The amino acids which are essential for increased protein synthesis
108 might have derived from an increased proteolysis of host tissue. The results given in table 2 shows a significant
109 raise ($p<0.001$) in liver tissue amino acid nitrogen levels. This increase may partly be due to increase in glutamic
110 acid formation through an increased activity of enzyme glutaminase (28). A significant decrease in liver tissue
111 amino acid nitrogen levels, seen in the present studies, in group 3 mice as compared to group 2 mice suggests
112 that DADS might have interfered with host tissue proteolysis hence causing a decrease in liver tissue amino acid
113 nitrogen levels. This decrease in liver tissue amino acid nitrogen levels in group 3 mice, in part, may be due to
114 decreased glutaminase activity (refer table 2) resulting in a lowered glutamic acid levels.

115 It is known that tumor cells prefer anaerobic glycolytic breakdown of glucose as compared to glucose oxidative
116 pathways. The observed increase in liver tissue Lactate content in group 2 mice is clearly suggestive of the above
117 statement whereas a significant decrease ($P<0.001$) in liver tissue lactate levels in group 3 mice as compared to
118 group 2 mice (refer table 2) indicates probably DADS might have interfered with cellular glycolytic pathways.
119 Many enzymes of glycolytic pathway including hexokinase, phospho fructo kinase (PFK) & pyruvate kinase
120 (PK) are thiol enzymes (09). DADS, a disulfide might have undergone sulfhydryl exchange reaction similar to
121 any other disulfide (27) as proposed above with glycolytic thiol enzymes hence reducing their activities which
122 results in decreased anaerobic glycolysis thus a decrease in output. This decrease in lactate level in group 3 mice
123 as compared to group 2 mice may also be due to lowered cellular NADPH or NADH levels in group 3 mice as
124 DADS is known to undergo reductive cleavage to its thiols using cellular NADPH or NADH, thus reducing the
125 available NADPH or NADH causing a decrease in lactate formation.

126 A reliable criteria for assessing the potential use of any anticancer agent is the prolongation of life span of
127 animals (16). Andreani et al (2) has suggested that an increase in lifespan of ascites bearing animals by 25% is
128 considered as indicative of significant drug activity. An increase in life span by 50% i.e. 25 (20) to evaluate the
129 effect of DADS on life span of hepatoma induced mice. The percent increase in life span was found to be 50%
130 and inhibitory growth rate percent was found to be 45.43% suggesting that DADS has a significant inhibitory
131 effect on tumor development.

132 In conclusion, DADS by interfering with protein synthesis as well as with the glucose breakdown in cancer
133 cells, results in reduced cancer cell proliferation & multiplication. Thus shows significant protection against EAC
134 induced hepatoma bearing mice.

glutaminase activity in liver tissue are significantly raised ($p<0.001$) in group 2 as compared to group 1, whereas the same parameters are significantly lowered ($p<0.001$) in group 3 as compared to group 2. It is also seen from the table that a significant decrease ($p<0.001$) in liver glycogen content & total thiol groups observed in group 2 as compared to group 1 & the same parameters are significantly raised ($p<0.001$) in group 3 as compared to group 2. However there is no significant change seen in transaminases (ALT & AST) activity in all the three groups.

Figure 2: table 1 &

in human colon cancer (18, 4, 19), by decreasing the kinase activity of CDK1/cyclin B complex. Further DADS 6 is a disulphide and like any other disulphides can undergo sulphhydryl exchange reactions with cellular proteins & enzymes (33) as follows-

A similar sulphhydryl exchange reaction with 201Enzines & other growth factors involved in cell cycle may suppress cell multiplication causing a reduction in the chemoprotective action against EAC induced hepatoma in mice, which is evident from the results obtained in the present studies (refer table 1 & 2). Cell proliferation as well as cell multiplication requires increased DNA produ-
