MRI-T1 and T2 Image Fusion for Brain Image using CDF Wavelet based on Lifting Scheme

By A. Bengana, I. Boukli Hacene & M. A. Chikh

University of Tlemcen, Algeria

Abstract- In the field of medical imaging. Image fusion is an important application for extracting complementary information from different modality. In this work, we propose a fusion algorithm using CDF9/7 wavelet based on lifting scheme with specified fusion rules to combine pairs of multispectral Magnetic Resonance Imaging (MRI) such as T1, T2. The experimental results of brain tumor show that the proposed algorithm preserves both edge and component information and also increases the efficiency of tumor detection. The parameters like mutual information MI, entropy EN, and spatial frequency SF, standard deviation SD are calculated to evaluate performance of proposed algorithm. Finally the results are compared with existing methods.

Keywords: image fusion, multispectral MRI-T1, MRI-T2, brain tumor, CDF9/7 wavelet, lifting scheme.

Abstract- In the field of medical imaging. Image fusion is an important application for extracting complementary information from different modality. In this work, we propose a fusion algorithm using CDF9/7 wavelet based on lifting scheme with specified fusion rules to combine pairs of multispectral Magnetic Resonance Imaging (MRI) such as T1, T2. The experimental results of brain tumor show that the proposed algorithm preserves both edge and component information and also increases the efficiency of tumor detection. The parameters like mutual information MI, entropy EN, and spatial frequency SF, standard deviation SD are calculated to evaluate performance of proposed algorithm. Finally the results are compared with existing methods.

Keywords: image fusion, multispectral MRI-T1, MRI-T2, brain tumor, CDF9/7 wavelet, lifting scheme.

I. INTRODUCTION

The medical image has seen an important development in the last two decades such as computed tomography (CT), magnetic resonance image (MRI), positron emission tomography (PET), and single photon emission computed tomography (SPECT). Now, the doctors need information from more than one modality for efficient disease detection and diagnosis. Medical image fusion is the technique of merging images belonging to different modality into a single resultant image that is provide complementary information for better analysis.

Image fusion can be grouped into three categories: Pixel level, Region level and Decision level. There are two approaches for pixel level method: spatial domain and transform domain [4]. Spatial domain fusion techniques are simple and fused image can be obtained by directly applying fusion rules on pixel values of source images such as Simple averaging, PCA (Principal Component Analysis) [5] and linear fusion [6]. But major disadvantage of spatial domain techniques are that they introduce spatial distortions in the fused image [7] and do not provide any spectral information. Transform domain techniques overcome the disadvantages of spatial domain fusion. Pyramid and wavelet transforms based techniques are the mostly used transform domain image fusion methods. Laplacian pyramid [8], contrast pyramid [9]. These methods overcome the disadvantages of spatial domain

techniques but suffer from blocking effect [7]. As a result wavelet transform based fusion [11, 12] approaches are used and it was found that no blocking effect occurred during fusion process. Discrete wavelet transform (DWT) [3] and integer wavelet transform [2] preserves different frequency information but may produce specularities along the edges and shift sensitivity, poor directionality and lack of phase information [15, 16]. The third type is new multiresolution methods are proposed, such as image fusion based on nonsubsampling contourlet transform (NSCT) [17]. Due to these limitations of real valued DWT. Another approach uses biorthogonal wavelet CDF 9/7 [18] based on lifting scheme provides better representation of fused image.

The objective of this research is to introduce CDF 9/7 wavelet based on lifting scheme to fuse more properties (edge, information) of different modalities such as MRI-T1 and MRI-T2 brain images (normal and tumor). The proposed algorithm is also uses the specified fusion rules of low and high frequency subbands. Experimental results on the Brain Web database show the usefulness of this wavelet family and clearly indicate its potential in medical image fusion. The rest of paper organization of this is as follows, the section 2 we present the proposed fusion algorithm steps with fusion rules. The experimental results are shown in section 3 and we compare results obtained with the existing techniques. Finally the main conclusions are summarized in Section 4.

II. PROPOSED FUSION ALGORITHM

The input Images can suffer from artifacts due to different factors. However the recent advances in acquisition protocol make it possible to acquire images with very limited artifacts. The proposed method is illustrated in Figure 1

Figure 1 : Block diagram fusion using CDF9/7 lifting wavelet transform (LWT)

a) Image de-noising using median filter (pre-processing)

This proposed system describes the information of enhancement using weighted median filter for removing high frequency component which characterize the noise. These filters have the robustness and edge preserving capabilities with noise attenuation characteristics. After the pre-processing operations the input images are subjected to wavelet analysis which is described in the following section.

b) Biorthogonal CDF9/7 wavelet based on lifting scheme [1]

Sweldens from Bell Labs proposed a method which does not depend on the Fourier transform of ascension wavelet construction in the mid 1990's presented in [19, 20], where sweldens showed that the convolution based biorthogonal Wavelet Transform (WT) can be implemented in a lifting-based scheme. The lifting-based WT consists of splitting, lifting, and scaling modules and the WT is treated as prediction-error decomposition. It provides a complete spatial interpretation of WT.

In this article we deals with biorthogonal wavelet 9/7, these wavelets are part of the family of symmetric biorthogonal wavelet CDF. The low pass filters associated with wavelet 9/7 have $p=9$ coefficients in the analysis, $p=7$ coefficients to synthesize. The wavelets 9/7 have a great number of null moments for a relatively short support. They are more symmetrical and very close to orthogonality [21]. Were the first to show the superiority of the biorthogonal wavelet transform 9/7 for the decorrelation of natural images

Figure 2 : The Lifting -based wavelet transform

c) Fusion rules

The input medical image (A, B) are decomposed using CDF9/7 lifting wavelet transform to obtain the low frequency (LL_A, LL_B) and high frequency ($LH_A, HL_A, HH_A, LH_B, HL_B, HH_B$) coefficients.

i. Lowpass subband fusion

The approximation coefficients are averaged, to preserve the features from both the images

$$LL_F = \text{mean}(LL_A, LL_B) \quad (1)$$

Where LL_F is the approximation band of the fused image.

ii. Highpass subband fusion

For each detailed sub bands, the spatial frequency is calculated using Equation SF.

$$LH_F = \begin{cases} LH_A & \text{if } SF_{LH_A} > SF_{LH_B} \\ LH_B & \text{otherwise} \end{cases} \quad (2)$$

Apply the same technique for: HL_A, HH_A, HL_B, HH_B

Finally, the inverse lifting transform based on CDF9/7 wavelet is applied to generate the fused medical image.

III. RESULTS AND DISCUSSION

In this section to evaluate the performance of the proposed algorithm. We fuse normal brain MRI-T1 image with MRI-T2 image from [24] data base. Similarly Brain tumor hypo intense T1 image with hyper intense T2 image are downloaded from [25].

To show the effectiveness of the multi scale transform the comparisons start with PCA (Principal Component Analysis) method, CDF9/7 DWT (discret wavelet transform) based filter banc and CDF9/7 LWT (Lifting wavelet transform) with the first level. To quantitatively compare the performance with existing fusion algorithms, entropy EN, mutual information MI, spatial frequency SF, standard deviation SD and time calcul T, are defined and calculated in the following section. These images were tested on Intel Core (I3) 2.13 GHz PC with 2GB of RAM using Matlab 2010a.

a) Entropy

Entropy is the quantity of information contained in a series of events. Entropy is a criterion that measures the level of information in the image, more entropy is large, more diffuse the image information.

$$EN = -\sum_{i=0}^{L-1} p_f(i) \log_2 p_f(i) \quad (3)$$

b) Mutual Information (MI)

Compares the image source and the fused image, more value is small, the relationship between the two images is non-existent.

$$MI = \sum_{a,f} P_{AF}(a,f) \log \frac{P_{AF}(a,f)}{P_A(a)P_F(f)} \quad (4)$$

$P_{AF}(a,f)$ The joint histogram between fused image F and the source image A.

c) Standard Deviation (SD)

Is the square root of the variance, the variance of an image reflects the degree of dispersion between the grayscale values and the average value of gray levels, more the standard deviation is large, more there are dispersion

$$SD = \sqrt{\frac{\sum_{i=0}^{N-1} \sum_{j=0}^{M-1} F(i,j)}{NM}} \quad (5)$$

d) Spatial Frequency (SF)

It measures the total activity and the level of clarity of an image, an important value mean that the result of fusion is good.

$$SF = \sqrt{RF^2 + CF^2} \quad (6)$$

Where RF and CF are the row frequency and the column frequency respectively.

The fused image output based on proposed method illustrate in Figure 3 and 4.

Figure 3 : Fusion results for Normal brain, (a) MRI-T1 image, (b) MRI-T2 image, (c) PCA fusion, (d) CDF9/7 DWT based fusion, (e) proposed fusion method

Figure 4 : Fusion results for Brain tumor, (a) brain image with T1 weighting, (c) PCA fusion, (d) CDF9/7 DWT based fusion, (e) proposed fusion method

This visual representation is not sufficient for analysis of the obtained fusion results. Therefore we have compared the proposed method with other ones on quantitative measures which are entropy, standard deviation, spatial frequency, mutual information.

Table 1 : Performance comparison for first set of Brain Web normal database

Methods	EN	SF	SD	MI	T(s)
PCA	5.56	24.89	49.77	3.92	1.11
CDF9/7DWT	6.23	38.04	51.10	5.43	1.78
CDF9/7LWT	7.33	46.92	97.84	5.80	1.46

Table 2 : Performance comparison for second set of Brain tumor

Methods	EN	SF	SD	MI	T(s)
PCA	6.93	23.83	49.43	3.20	0.02
CDF9/7DWT	7.01	35.27	49.36	5.85	1.24
CDF9/7LWT	7.12	44.42	89.23	5.98	1.52

For Table1 and 2, The graphical representation of all performance evaluation parameters are shown in figure 5.

Figure 5 : The graphical of different methods using evaluation parameters

IV. CONCLUSION

In the present work, we have introduce a new multimodal medical image fusion using CDF9/7 wavelet based on lifting scheme and its essential objective as to retrieve complementary information from different modality to aid doctors for a good diagnosis. The algorithm is evaluated on the Brain Web database and brain tumor. The experimental results showed that the proposed algorithm conserves important edge and spectral information without much of spatial distortion. Finally, these results are compared with different methods (PCA and CDF9/7 DWT based filter banc). In perspective, we plan to extend our study (proposed algorithm) by incorporating learning techniques.
