Abstract

Prevalence of tobacco use is high among adults and youth in India, resulting in high mortality from diseases associated with it. Studies in different countries have established the consistency of the association between movie smoking and adolescent smoking. Besides having the largest population of adolescents in the world, India also is one of the major movies producing countries. Moreover a large number of Indian films have been found to display tobacco branding. Indian movies have large viewership not only in the country, but all over the world, making youth vulnerable to exposure to smoking scenes. The Indian anti tobacco law provides for ban on all forms of advertisements, promotion and sponsorship of tobacco products. The Indian Government tried to regulate smoking scenes in movies as per the provisions under the law way back in the year 2005. This was met with strong resistance by the film industry arguing inference in the freedom of expression by these provisions which were challenged in the court of law. Subsequent to support from the judiciary and positive rulings from the court of law, the Government went ahead and implemented regulation on scenes showing smoking and other tobacco use in movies and television programmes in October 2012. The law is under implementation For desirable and effective impact of the legislative provisions for regulating scenes depicting smoking and tobacco use in the movies, it is imperative to ensure that the motion pictures no longer serve as a source of tobacco promotion aimed at adolescents and youth.

Index terms— tobacco, smokefree movies, anti-tobacco law, India.

1 Introduction

India is the second largest consumer of Tobacco products in the world with 35% of adults (15 years and above) consuming tobacco. 1 Overall tobacco use among males is 48% and among females is 20%. As per GYTS (2006), 14.1% 13-15 years school going children in India use tobacco products. It is interesting to note that the tobacco products use by the youth is also predominantly smokeless tobacco products, as is amongst the adults. 2 In the age group, 30 years and above, the proportion of deaths attributable to tobacco is almost 24% for men and 12% for females. Among those who die prematurely, almost one in every 8 deaths among those aged 30-44 years and one in 5 among those aged 45-59 years is attributable to tobacco use. 3 The next section of this article briefly introduces the literature review using pubmed, internet, published reports, and perspectives relating to evidence of association between smoking scenes in films and imagery and smoking by adolescents and youth.

India is one of the major film producing countries in the world. There has been a steady increase in production of films over the years. While 764 Indian feature films were certified in the year 1999, the number increased to 1325 in 2008. In 2011, a total of 814 films were produced during the period ranging from April to November. 20

2 Smokefree Movies in India-Converting Evidence into Action

There is growing evidence that an adolescent's decision to try cigarettes is influenced by level of exposure to movies in which smoking is portrayed. Many studies in United States have indicated that higher exposure to

3 DISCUSSION

43 smoking in entertainment programming leads to greater initiation among youth possibly through social modeling
44 and by reducing resistance to counterarguments. [4][5][6][7] Some other studies linked smoking status of an
45 adolescent's favorite movie star to attitudes and smoking behaviour. [8][9][10] The effect of exposure to movie
46 smoking on behavior has also been shown to be mediated through attitudes towards smoking 11 and smoking
47 status of peers. [12][13] A cross cultural study involving six European countries established the consistency of the
48 association between movie smoking and adolescent smoking, despite their substantial differences in culture and
49 tobacco policy, and after covariate control for the number of movies seen, adds further weight to the argument that
50 smoking in movies is an independent risk factor for smoking uptake in youth. 14 Evidence from India has found
51 that specific media content such as media advertising is associated with higher smoking rates 15 , and exposure to
52 cigarette brand names or actors smoking on television have been found to be related to increased youth smoking
53 in India. 16 One study provided evidence that exposure to pro-tobacco content in television and cinema may
54 promote tobacco use among men and women in India. 17 Another Indian study found a strong association of
55 tobacco use by the adolescents with having seen various role models ever smoking. 18 It is noteworthy that
56 India has the largest population of adolescents in the world, being home to 243 million individuals aged 10-19
57 years. The country's adolescent constituted 20 percent of the world's 1.2 billion adolescents. 19 Indians working
58 abroad and building a fan base in industrialized countries. Entry into the Indian film market is also a potential
59 growth area for the United States film industry. For these reasons, national interventions in India can have
60 a global impact on reducing youth exposure to tobacco imagery. 21 The Indian anti tobacco law provides for
61 ban on all forms of advertisements, promotion and sponsorship of tobacco products. ??2 The law also provides
62 for regulating smoking scenes in movies. A few years ago the Indian government tried unsuccessfully to ban
63 all smoking scenes in movies, as the provision was legally challenged. 23 A study of India's indigenous cinema
64 industry conducted by WHO and the Ministry of Health and Family Welfare in 2003 (before the anti tobacco law
65 was enacted) revealed that 76% of top-grossing films during 1990-2002 depicted tobacco use, tobacco incidents
66 attributed to the lead actors growing from 22 % in 1991 to 54% in 2002. 24 Another study which was conducted
67 after the anti tobacco law banned all tobacco advertisements revealed that 89% Hindi -language films produced in
68 2004-05 depicted tobacco use and smoking scenes were attributed to lead actor in 76% of the films. Interestingly
69 46% films, mostly large-budget films, displayed tobacco branding. 25 II.

3 Discussion

71 The tobacco industry has long recognized the value of smoking in movies to promote cigarettes and developed
72 extensive programs to promote smoking in the movies. 26 The images of smoking in movies both normalize
73 the behavior and downplay the negative health effects associated with smoking, encouraging more tolerant,
74 neutral, or nonchalant attitudes about smoking. Although teens generally acknowledge the long-term health
75 risks associated with smoking, they immediately experience the perceived short-term benefits of smoking, such
76 as looking tough or sexy or fitting in with their peers, which reinforces and motivates adolescent smoking. 27
77 Movies are such a powerful influence on adolescents that they can negate the effects of positive parental role
78 modeling on smoking. 28 Looking at the strong empirical evidence indicating increased adolescent smoking
79 initiation associated with smoking scenes in movies, amending the movie rating system to rate movies containing
80 smoking as "R" should reduce adolescent exposure to smoking and subsequent smoking. It is further established
81 that viewing antismoking advertisements before viewing movie smoking seemed to blunt the stimulating effects
82 of movie smoking on adolescent smoking. 29 Concern about the impact of exposure to tobacco imagery in movies
83 on youth smoking led the World Health Organization (WHO) to recommend that all future movies with scenes
84 of smoking should be given an adult rating, with the possible exception of movies that reflect the dangers of
85 tobacco use or that depict smoking by a historical figure who actually smoked. 30 Implementing this policy would
86 substantially reduce the dose of onscreen smoking delivered to children and adolescents and the corresponding
87 response of smoking initiation. 31 1. All new Indian and foreign films and television programmes displaying
88 tobacco products or their use shall have to submit a strong editorial justification explaining the necessity of the
89 display of the tobacco products or their use in the film, to the CBFC.

90 2. Screening of anti tobacco health spots of minimum thirty seconds duration at the beginning and middle
91 of the films. This also applies to old Indian and foreign films and old television programmes displaying tobacco
92 products or their use.

93 3. Display of anti tobacco health warning as a prominent static message at the bottom of the screen during
94 the period of display of the tobacco products or their use in the film and television programme.

95 4. Screening of an audio-visual disclaimer on the ill effects of tobacco use, of minimum twenty seconds duration
96 each, in the beginning and middle of the film and television programme.

97 5. The health spots and disclaimer will be made available to the CBFC by the Ministry of Health & Family
98 Welfare, Government of India.

99 6. The failure to comply with the aforesaid provisions by the owner or manager of the cinema hall or theatre
100 or the broadcaster of the television programme will lead to cancellation or suspension of the licence.

101 The efforts of Ministry of Health in India to provide for adult rating to the movies with smoking scenes were
102 countered by the Ministry of Information and Broadcasting, citing practical difficulties faced by the film industry
103 in implementing the same. Although it directed the Central Board of Film Certification (CBFC) in May 2012 to
104 ensure featuring a twenty second anti smoking message approved by Ministry of Health with voiceover of one of

105 the actors who is seen smoking in the film at the beginning and middle (after interval) of the film and display of
106 a static anti smoking message for the duration of smoking scene in the film. ??2 There was further resistance to
107 these provisions by the film industry arguing inference in the freedom of expression by such provisions. Finally
108 the new law was notified and come into effect from 2 nd October, 2012 after a long legal battle and intense
109 deliberations with the Ministry of Information and Broadcasting. 33 The law has the following provisions:
110 initially. The film industry also tried to influence the Ministry of Information & Broadcasting and the media
111 and tried to gain public sympathy by pleading that the law was a direct interference with their freedom of
112 expression. However the Hindi-language and regionallanguage films and television programmes have now started
113 following and implementing the provisions under the law. How much impact this regulation ultimately has on
114 prevention of adolescent smoking and tobacco use needs further research.

115 4 III.

116 5 Conclusion

117 At least 7300 feature length movies were produced and released in 2009 (many directly to video) in fifty nations
118 worldwide, including 1341 (18%) in the European Union, 1288 (17%) in India, 677 (9%) 56 (6%) in China and
119 448 (6%) in Japan. 34 The tobacco industry knows that motion pictures are one of humanity's most common
120 entertainment experiences. The world spends approximately US \$ 120 billion a year to view films through
121 legitimate distribution channels. 21 India leads the world with highest actual admissions into movie theatres (2.7
122 billion in 2010). ??5 The depiction of tobacco use in the movies in India, which has one of the most active film
123 industry globally, remains an active vehicle for promoting smoking and other tobacco products use, including
124 in films rated as suitable for children and adolescents. A recent study finding suggested that scenes depicting
125 tobacco use are shown in Bollywood movies even after the enactment of COTPA in 2004, Section 5, which
126 prohibits direct and indirect forms of tobacco advertising and further provides evidence of association between
127 seeing tobacco use in movies and youth tobacco use in India. 36 Hence it becomes imperative that the legislative
128 provisions for regulating scenes depicting smoking and tobacco use in the movies are implemented in letter and
129 spirit to ensure that the motion pictures no longer serve as a source of tobacco promotion aimed at young people.
130 This along with the other provisions in the Indian anti tobacco law which aim at reducing access of minors (below
131 18 years of age) to all tobacco products, if strongly enforced will go a long way in preventing the youth from
132 taking up tobacco use in India.

133 6 IV.

134 Volume XIII Issue III Version I As the provisions are quite stringent, the film industry was much reluctant to
135 implement the same ¹
